HEARTBURN

- Most common GI complaint in the western countries
- “A burning feeling rising from the stomach or lower chest up toward the neck”
- Frequently noted within 1 hour after eating, particularly large meal
- Common symptom of gastroesophageal reflux disease (GERD)

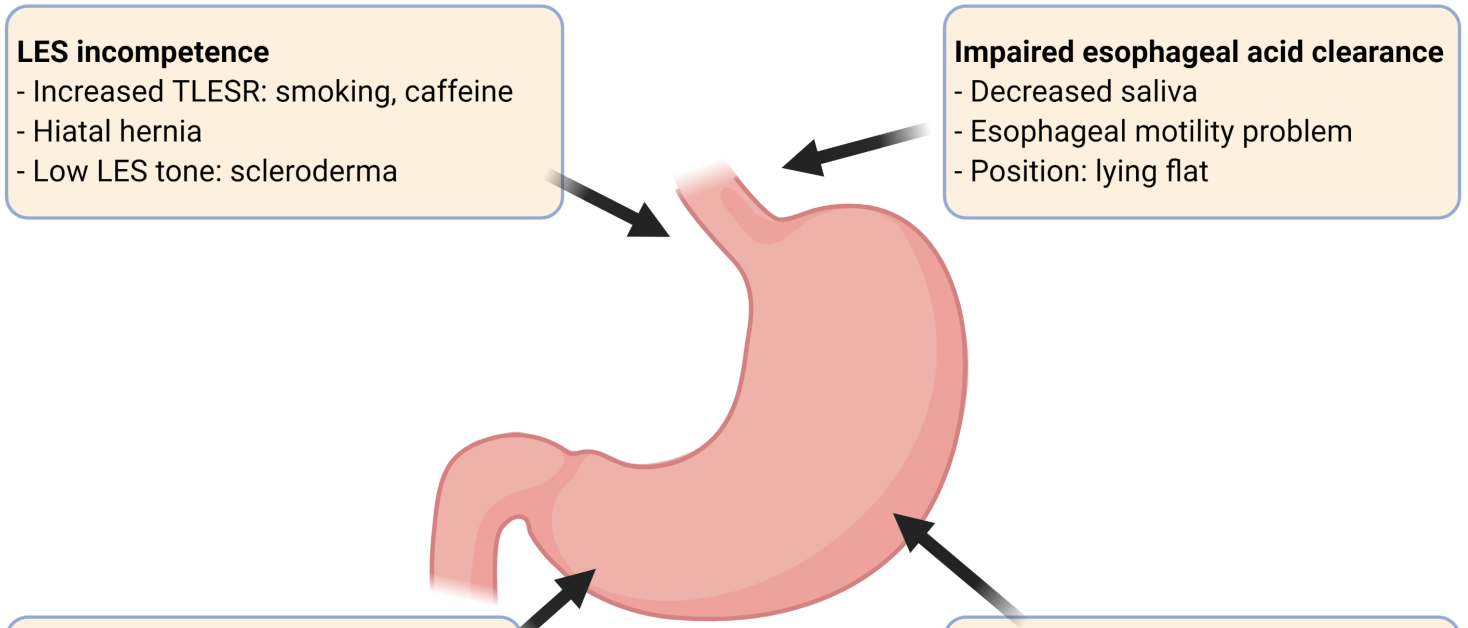

PRECIPITATING FACTORS OF HEARTBURN

- Certain food:
  - sugars, chocolate, onions, carminatives, fatty food, caffeine → reduce LES pressure
  - Citrus products, soft drink, spicy food, alcohol → irritate esophageal mucosa
- Position: lying on their back or right side soon after meal
- Weight gain
- Increased intra-abdominal pressure: straining, bending over, lifting heavy object, weight training exercise

PRECIPITATING FACTORS OF HEARTBURN

- Certain types of exercise: running
- Smoking: reduces LES pressure and increases gastric acid secretion
- Emotional stress: lowering visceral sensitivity thresholds
- Medications: Progesterone, Theophylline, Diazepam , Calcium channel blockers → reduce LES pressure

PATHOPHYSIOLOGY OF GERD

THANK YOU
